SERVICE BRIEF
Firewall & Web Content Filtering
Keep your organization secure against threats from the outside.

Apply Filters To User Groups

Applying filters to user groups allows only work-related content to be accessed.

In order to grow as a company in today's digital world, you have to provide your employees with resources that make them more efficient. The Internet is one of most important resources your employees will require. Unfortunately, if not controlled properly, granting access to the internet can create its own inefficiencies.

With free access to the internet, employees may be prone to use it for non-work related task. By the capabilities to control access to certain types of content, such as Facebook, Twitter, YouTube, and even Netflix, you ensure that your employees are staying on task throughout the day. Some employees may require access to certain sites, for promotion and marketing purposes, while others

do not. With our Content Filtering solution, you can control who is given access to what by setting up specific user groups with access levels.

By creating user groups, and assigning access rights to them, you control what messages filter to what group, and control what is designated as spam for those groups, and what isn't. After your initial configuration of the software, you can then move users into groups, thoroughly managing the type of content made available to them.

Reduce Security Threats

Gain complete control over your security by blocking access to distasteful content.

One of the most crucial parts of business administration is being able to protect personal information, and other sensitive material. Unfortunately, there are people in the world that mine for information, and sell it for their own self-interest. A number of these entities are specifically designed to retrieve information with the use of coordinated instructions.

Some of these strategies involve delivering malware; in the form of a virus, Trojan horse, or Internet worm to distasteful mediums that get a lot of traffic. If a user accidentally navigates to these types of sites, it can create security problems. A simple search for "free software" can lead users to infested sites that look completely legitimate. Once a user downloads the file and opens it, your entire network can be compromised with malicious entities. With our Content Filtering solution, you have complete control over the prevention of these types of threats.

Features

- Prevent employees from accessing inappropriate or distracting content on the company network

- Enable only those employees who need access to potentially distracting sites to do so

- Management of these permissions with user groups

- Blocks malware and other malicious entities from infiltrating and abusing your network and data

- Prevents your users from accessing websites that are potential delivery systems for malware

Benefits

- Preserves employee productivity by preventing them from accessing distracting, non-work-related websites

- Simplifies managing who can access what on your network

- Protects your network from viruses, worms, and other varieties of malware

- Disables employees from inadvertently downloading malicious content from the Internet
